■■ CYBER LAW WATCH AGENT

Beta Tester Setup & Usage Guide

Confidential • Build Date: 14 October 2026 • Platform: Windows 10/11 (64-bit)

What You're Testing

The **Cyber Law Watch Agent** is an AI-powered legal intelligence platform that continuously monitors authoritative Indian cyber law sources and surfaces critical rulings to legal practitioners.

Feature	Description
■ Live Feed	Monitors Supreme Court, High Courts, RBI, CERT-In, MHA/I4C
■■ Auto-Classification	P0 Critical / P1 High / P2 Info priority tagging
■ Matter Matching	Maps case law to active client CMS matters
■ AI Co-Pilot	Natural language legal queries powered by Google Gemini
■ Lawyer Review	Sign-off workflow for each ingested ruling

Prerequisites

■ **Python is the ONLY software you need to install. Node.js is NOT required.**

Python 3.11 or Higher

Check if Python is already installed — open PowerShell and run:

```
python --version
```

If you see **Python 3.11.x** or higher — skip to the Setup section below. Otherwise, install it:

- Download from **python.org/downloads**
- Run the installer
- ■ **Check "Add Python to PATH"** — this is critical!
- Click **Install Now**

Verify after installation:

```
python --version
pip --version
```

One-Time Setup (Do This Once)

1 Extract the ZIP

Extract the provided **CyberLawWatchAgent.zip** anywhere on your computer.

You should see this folder structure:

```
cyber_watch_agent/
■■■ dist/
■ ■■■ CyberLawWatchAgent.exe ← the launcher
■■■ backend/
■ ■■■ requirements.txt
■ ■■■ .env ← API key config
■■■ frontend/
■■■ out/ ← pre-built UI
```

■ Do NOT move CyberLawWatchAgent.exe out of the dist/ folder. It finds the backend relative to its location.

2 Install Python Dependencies

Open **PowerShell** or **Command Prompt** inside the extracted folder and run these commands one at a time:

```
cd backend
python -m venv venv
venv\Scripts\activate
pip install -r requirements.txt
```

■ This downloads ~500 MB of AI/legal packages (langchain, fastapi, etc.). It only needs to be done **once**. Grab a coffee ■

Expected final line:

```
Successfully installed fastapi uvicorn langchain ... (many packages)
```

3 Configure the Gemini API Key

The AI Co-Pilot requires a **Google Gemini API Key**.

- Open **backend\.env** in Notepad or any text editor
- Find the line: **GEMINI_API_KEY=**
- Paste your API key after the = sign
- Save the file

```
GEMINI_API_KEY=AIzaSy...your-key-here...
```

✔ No key? Get a free one at **aistudio.google.com/app/apikey** | The app works without a key — only the AI Co-Pilot tab will show an error.

Running the Application

Method	How
Double-click	Navigate to **dist** and double-click **CyberLawWatchAgent.exe**
PowerShell	`.\dist\CyberLawWatchAgent.exe`

What You'll See in the Console:

```
============================================================
C Y B E R L A W W A T C H A G E N T
============================================================
App : http://127.0.0.1:8080
API : http://127.0.0.1:8080/api/v1/docs
============================================================

[LAUNCHER] Starting server on http://127.0.0.1:8080 ...
[LAUNCHER] ✔ Server ONLINE — opening http://127.0.0.1:8080
```

■ The browser opens **automatically** at **http://127.0.0.1:8080** in 5–15 seconds. First startup may take 30–60 seconds while the database initialises.

What to Test

Section	What to verify
■ Dashboard Feed	Rulings load with P0/P1/P2 priority badges
■ Search & Filter	Filter by authority (Supreme Court, RBI), date range, priority
■ Document Viewer	Click a ruling — full text and PDF viewer open in the right panel
■ Matter Matching	Check rulings map to active client matters in the sidebar
■ Lawyer Review	Submit an Approved / Rejected / Needs Review decision on a document
■ AI Co-Pilot	Ask: *"What are the latest bank freeze rulings?"* — response should cite sources
■ API Key Config	Click the ■ button in the header — validate your Gemini key live
■ Refresh Feed	Click Refresh Feed — triggers live scrape from authoritative sources

To Stop the App:

Press **Ctrl + C** in the console window, or simply close the console window.

Troubleshooting

■ "Backend directory not found"

The .exe must stay inside the **dist** folder. Do NOT move it out of the extracted ZIP structure.

■ "Virtual environment not found"

You have not completed Step 2. Open PowerShell in the project root and run:

```
cd backend
python -m venv venv
venv\Scripts\activate
pip install -r requirements.txt
```

■ Browser opens but shows a blank page

The static UI files are missing. Contact the dev team — they need to re-share the build with frontend/out/ included.

■ AI Co-Pilot says "Error connecting to backend"

Your GEMINI_API_KEY is missing or incorrect in backend\.env. Click the ■ API Key Config button in the app to validate it live.

■ Port 8080 already in use

Another process is using port 8080. Find and stop it:

```
netstat -ano | findstr :8080
taskkill /PID /F
```

■ Antivirus blocks the EXE

PyInstaller exes sometimes trigger false positives. Add CyberLawWatchAgent.exe to your antivirus exclusion list, or run it from PowerShell.

Reporting Issues

When reporting a bug, please include:

- **What you did** — steps to reproduce
- **What you expected** to happen
- **What actually happened** — error message or screenshot
- **Console output** — copy the text from the black launcher window
