Project Name

Cyber Law Intelligence & Regulatory Watch Agent

Objective

Build an internal AI-driven legal intelligence system that continuously monitors authoritative sources for developments in Indian cyber law and cybercrime-related regulation, identifies material changes, classifies them, summarises practical impact, and maps relevant developments to our active legal matters.

The system is **not a generic news scraper**. Its purpose is to detect actionable legal changes for our cyber practice.

Initial Scope

Start only with cybercrime matters relating to:

- bank account freeze / debit freeze / lien
- NCRP complaints
- mule accounts
- disputed transaction amount
- police powers
- jurisdiction
- victim restitution
- bank obligations
- digital fraud
- digital arrest
- BNSS / BNS / IT Act
- cyber-related RBI / MeitY / I4C / CERT-In developments

Initial Sources

Monitor selected official/public sources such as:

- Supreme Court of India
- selected High Courts
- RBI
- MeitY
- Ministry of Home Affairs / I4C
- National Cyber Crime Portal
- CERT-In

- e-Gazette
- other approved regulators as added later

Use official/public sources first. Do not build the system around unauthorised scraping of commercial legal databases.

Core Workflow

1. Source Registry

Maintain a structured list of approved sources with:

- source name
- URL/feed
- authority level
- source type
- subject area
- frequency of checking
- last successful check

2. Document Discovery

The system should detect:

- new judgments
- new circulars
- notifications
- guidelines
- advisories
- draft rules
- amendments
- corrected / superseded documents

Avoid duplicate ingestion.

3. Evidence Preservation

For every item save:

- original source URL
- title
- authority
- publication date

- retrieval date
- full document/PDF if permitted
- document hash
- version history

The original source must always remain available for verification.

4. AI Classification

Automatically tag each development by legal topic.

Initial tags:

- BANK ACCOUNT FREEZE
- LIEN
- NCRP
- MULE ACCOUNT
- DIGITAL FRAUD
- DIGITAL ARREST
- POLICE POWERS
- JURISDICTION
- BANK LIABILITY
- VICTIM RESTITUTION
- BNSS
- BNS
- IT ACT
- DIGITAL EVIDENCE
- INTERMEDIARY LIABILITY
- DATA PROTECTION
- CYBER SECURITY

Allow multiple tags.

5. AI Impact Note

For every potentially relevant development generate a short structured note:

What happened
Brief summary.

Authority
Court/regulator and date.

Legal status
Final judgment / interim order / circular / notification / advisory / draft.

What changed
Whether it changes or clarifies existing legal position.

Practical relevance
How it may affect our cyber matters.

Caution
Any jurisdiction, factual, statutory or precedential limitation.

6. Relevance Scoring

Classify each development:

- **P0 — Immediate:** may affect an active matter or filing
- **P1 — Important:** significant cyber-law development
- **P2 — Background:** useful knowledge
- **P3 — Archive:** low relevance/no immediate action

Avoid flooding users with notifications.

7. Lawyer Validation

AI output must never automatically become trusted legal knowledge.

Provide review options:

- Relevant
- Not Relevant
- Needs Senior Review
- Apply to Matter
- Monitor
- Approved to Knowledge Base

Only lawyer-approved material should enter the trusted knowledge base.

8. Matter Matching

Later in MVP / Phase 2, connect the system with our Cyber CMS.

Example:

A new judgment concerns third-party bank account freezing.

The system should identify active matters tagged with:

- third-layer account
- sixth-layer account

- full debit freeze
- disputed amount mismatch
- lien despite refund

and suggest:

“This development may affect these matters.”

No automatic legal action should be taken.

9. Action Creation

If approved by a lawyer, the development can generate a proposed T-63 task such as:

Review the impact of Judgment X on Matter Y and update the representation/legal strategy if required.

The task should still require human approval.

MVP Dashboard

Basic dashboard should show:

New Developments

Number discovered.

AI Filtered

Potentially relevant developments.

Lawyer Review Pending

Items requiring validation.

Action Required

Items mapped to active matters.

Suggested columns:

| Title | Authority | Date | Topic | Relevance | Matched Matters | Review Status |

Recommended Technical Stack

Use existing internal stack where practical:

- **Backend:** FastAPI
- **Database:** PostgreSQL
- **Task scheduler/background jobs:** Redis/Celery or equivalent
- **Frontend:** simple browser dashboard
- **Storage:** controlled local/server storage initially
- **AI:** LLM-based classification and summarisation

- **Document parsing:** PDF/text extraction with source-page references

Architecture should remain modular so new legal domains can later be added without rewriting the core engine.

Important Technical Requirements

No uncontrolled scraping

Respect website terms and robots/access restrictions.

Deduplication

Do not repeatedly store the same judgment/circular.

Version control

If an authority changes a document, preserve both versions.

Source-first AI

AI summaries must always link back to the original source.

Citation

Where possible, record page/paragraph references supporting the AI summary.

No hallucinated law

If the model cannot confidently identify a proposition, mark:

“Requires lawyer review.”

Audit trail

Record:

- when item was discovered
- AI classification
- user who reviewed it
- changes to classification
- approval/rejection
- matter linkage

MVP Boundaries — Do Not Build Yet

Do not initially build:

- all areas of Indian law
- predictive case outcomes
- autonomous legal opinions
- automatic drafting of petitions

- automatic filing
- scraping commercial legal databases without permission
- mobile app
- complex knowledge graph
- client-facing portal

Focus first on making the monitoring and filtering reliable.

Phase Sequence

Phase 1

Source monitoring + document discovery + storage + duplicate detection.

Phase 2

AI classification + impact summaries + relevance scoring.

Phase 3

Lawyer validation dashboard.

Phase 4

CMS matter matching.

Phase 5

T-63 task generation.

Phase 6

Trusted Cyber Legal Knowledge Base.

Success Test

The MVP succeeds if:

A material cyber-law judgment, notification, circular or advisory is automatically detected, correctly classified, summarised with its limitations, presented to a lawyer for review, and—where relevant—mapped to an active matter without requiring us to manually search for it.

Core Architecture Principle

Source → Detect → Preserve → Classify → Analyse → Human Validate → Match to Matter → Generate Action

Do not optimise for the number of documents collected.

Optimise for **material legal developments that lead to useful action**.
